

IT 426 Final Project

Task:

Augment either the Inventory or Time project presented in class.

Specifications:

C – Use either project as a starting point for your final project. The Inventory project might be augmented by adding more fields, or different ways of sorting. The Time project might ask for two different dates and times, instead of just one. Whatever you decide to do, the project must clearly be enhanced beyond the work done in class. The Final Project is presented as part of a themed website.

B – Validate all input.

Use controls that limit possible user errors where possible. Otherwise use validation techniques to check all other user input.

A – Add two items of your choice from the following list:

1. Incorporate the other project into your main project.
For example, build an Inventory system that reports how long items have been in stock, or a time calculator that tracks the difference between today and several different dates which are shown in a history table.
2. Add another graph that only appears when necessary. For example, it might only chart low volume inventory items and appear as part of a pop-up warning to "order now". Or this graph might use a value calculated from user input to visualize the data in a different way.
3. Create and display a second inventory list that shows what has been recently removed from the total inventory. It should be possible to reset this list at any time. This may also use a graph to display information
